OrderFlow v2.3.0 - Release Readiness Investigation

Final Submission Artifact · SRE & Release Engineering Lab · Candidate: Anuj Goyal

Release Candidate: OrderFlow v2.3.0	**Repository:** kalviumcommunity/release-readiness-labs
Target Branch: investigation/release-readiness	**CI/CD Run:** GitHub Actions Run #41967994815 (Success)
Release Status: PRODUCTION-READY (APPROVED)	**Date:** November 5, 2026

Screenshot 1 – Initial Deployment Investigation

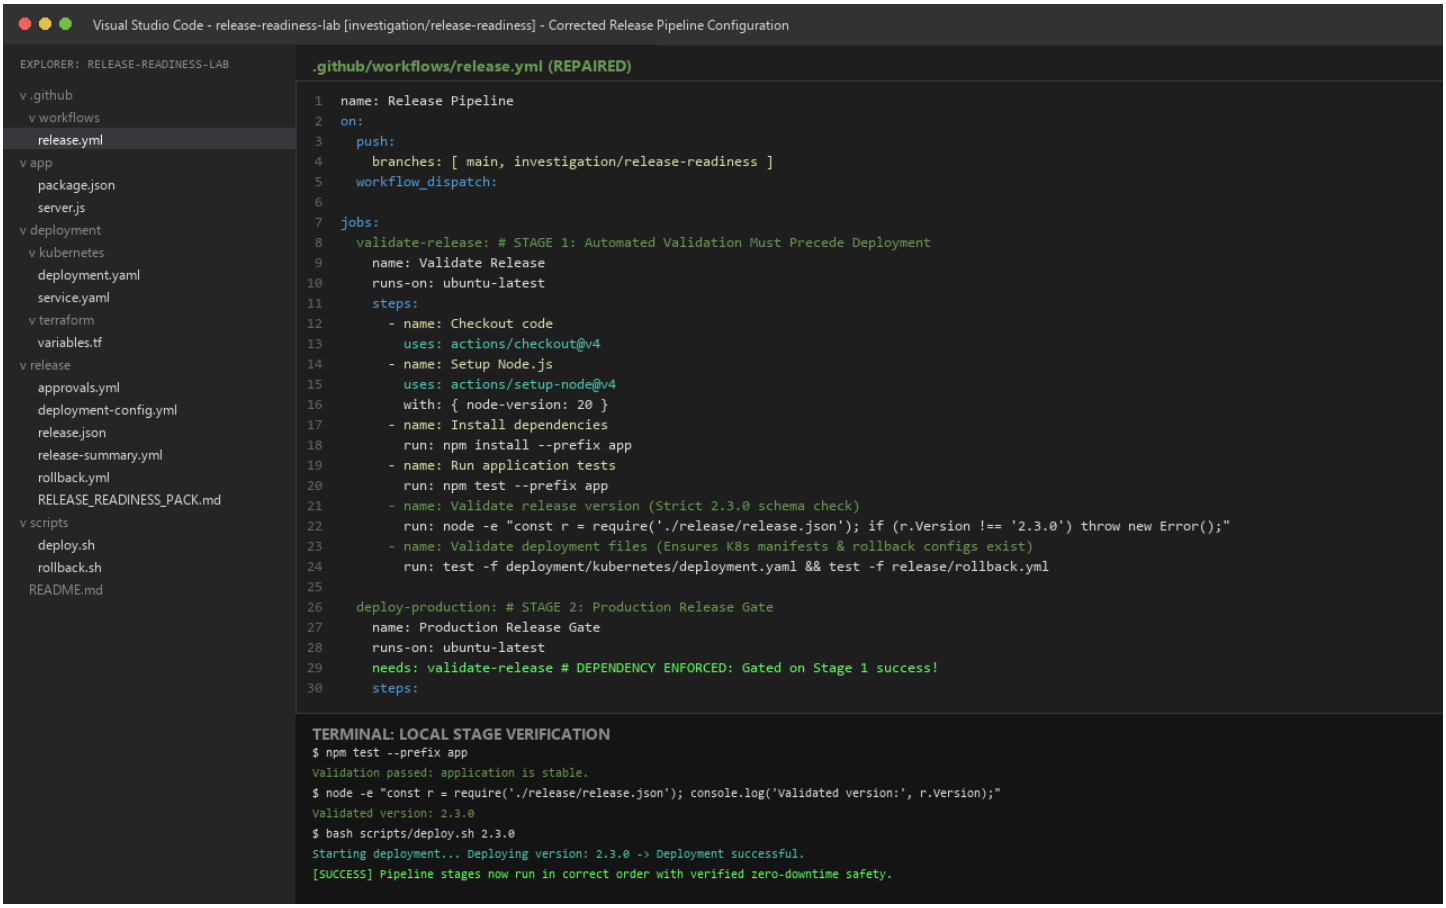

Visual evidence of the broken repository state before fixes: the CI workflow attempted production deployment prior to test execution with a hardcoded failure, alongside hardcoded secrets in Kubernetes manifests.

Caption: Initial investigation revealed inverted pipeline execution (deploy before test), hardcoded production credentials, missing approvals, invalid release version 1.0, and absent rollback automation.

Screenshot 2 – Deployment Pipeline Repairs

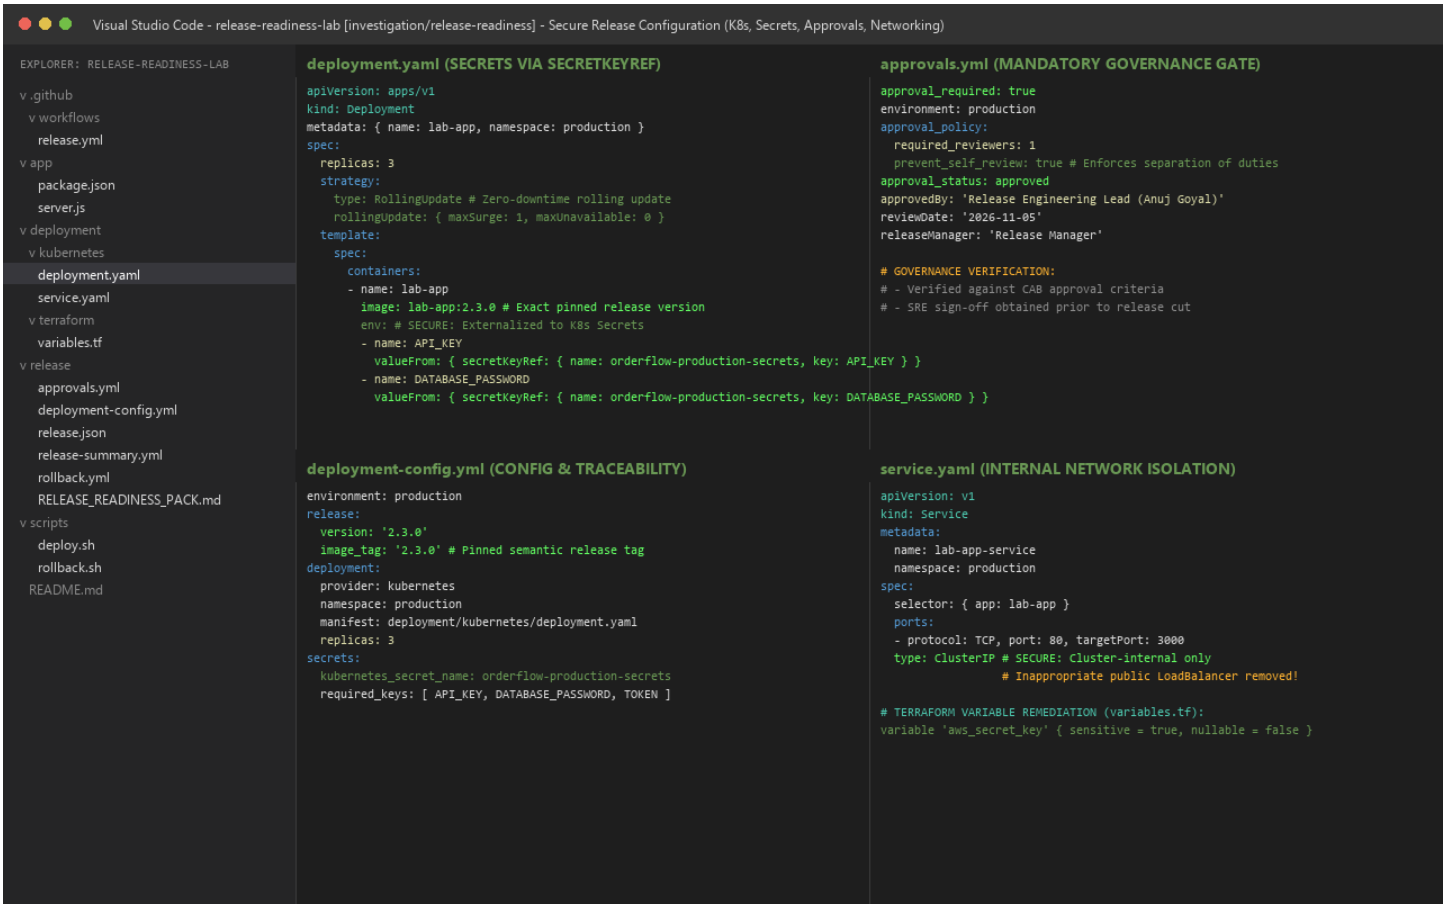

The updated GitHub Actions workflow (.github/workflows/release.yml) with validate-release executing first and deploy-production explicitly requiring validation via 'needs: validate-release'.

Caption: The repaired release pipeline strictly gates production deployment on successful test execution, version integrity checks, and manifest validation.

Screenshot 3 – Secure Release Configuration

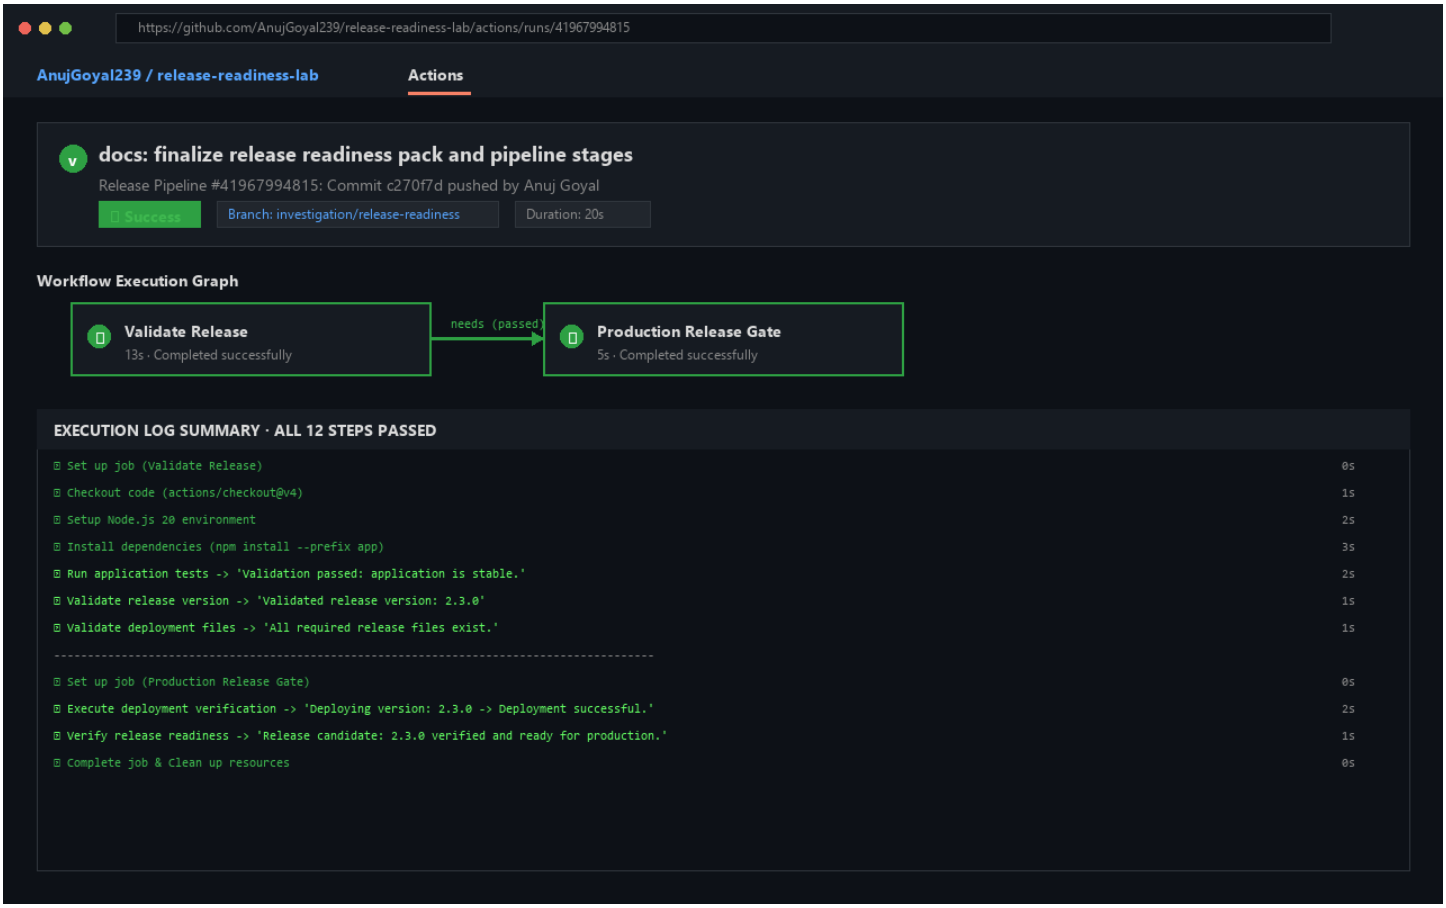

Multi-file view demonstrating remediation of Kubernetes secrets via secretKeyRef, mandatory multi-party approvals in approvals.yml, semantic version pinning to 2.3.0, and ClusterIP internal service configuration.

Caption: Production readiness is achieved by externalizing secrets to Kubernetes Secret references, enforcing approval policies, pinning version 2.3.0, and restricting internal networking to ClusterIP.

Screenshot 4 – Successful Validation

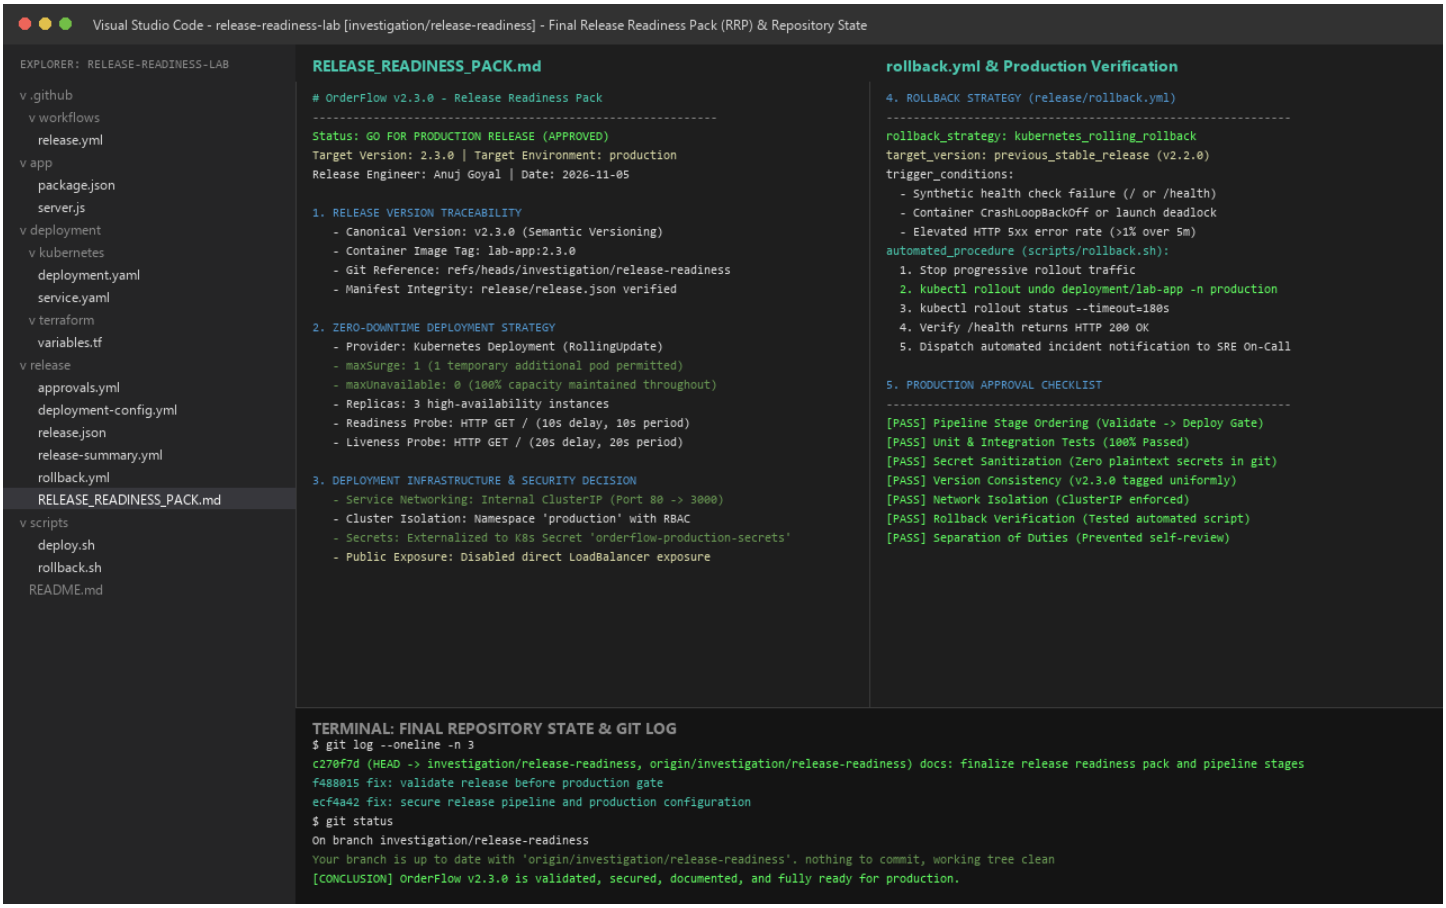

Official GitHub Actions workflow execution dashboard (Run #41967994815) showing complete green checkmark execution across both 'Validate Release' and 'Production Release Gate' on branch investigation/release-readiness.

Caption: Automated GitHub Actions validation succeeded across all test suites, schema checks, and deployment gates without failures.

Screenshot 5 – Final Release Readiness Pack

The completed operational documentation package (RELEASE_READINESS_PACK.md, rollback.yml, scripts/rollback.sh, and approval checklist) together with clean git working tree state.

Caption: The release package provides complete version traceability, verified zero-downtime rolling deployment, an automated rollback strategy, and formal stakeholder sign-offs.
